Contemporary Issues Reflection

1. Who was the professor in your discussion group? Henry Duwe
2. Name a contemporary engineering issue that was discussed during the meeting. What is its impact on society? What are some ideas you have or your group had for solving it if it can be solved?
 - One of the things we discussed was autonomous vehicles, and how it can impact society because if there are issues with the hardware/software the cars could crash, or they could even be hacked which would be very dangerous. The solution would be a lot of testing and security features.
3. What did you discuss in your small group about the engineering profession?
 - We discussed how important it is as it is needed to solve some of the biggest issues that our society faces.
4. What perspectives did your group state needed to be considered to solve your contemporary issue?
 - I honestly don't quite remember discussing perspectives, as it's been several weeks and I don't remember everything from the meeting.
5. What was your major take away from the discussion you had with your discussion group?
 - My major take away was that many of the big issues that we face today can be solved with engineering applications, even if they might not be obvious at first.
